Clare videtur	—	—	—	—	—	6	56	38

E METEOROLOGICIS.

HYems hoc anno temperata erat. Mensibus Januario & Februario mercurius in thermometro Fahrenheitiano fere in 25, 30; rarius in 21 gradu horis matutinis visabatur. 22 Januarii in 20 gradu hæsit. Maximum frigus 15. Decembris observatum est. Mane mercurius ad 3. gradum descendit. Cælum erat sudum, & boreas nocte tota vehementius spirabat.

Æstas ardores habuit intensos. Mensibus Junio, Julio & Augusto mercurius in thermometro sæpe horis pomeridianis ad 80, 82, 85, gradum ascendit. Die 28 Julii ad 82½ post meridiem pervenit. à plaga occidua lenis spirabat ventus, & sol sub rarioribus nubeculis erat. Exorta sub vespem modica cum pluvia tempestas æstum temperavit, & tum mercurius ad 75 gradum decidit.

Altitudo maxima mercurii in barometro erat pollicum Parisiensium 27, 11 ½ linearum Die 5ta Novembris. Cælo sereno, spirante vento septentrionali.

Altitudo minima erat pollicum 26, linearum 9, die 12 Mart. Cælo pluvio, flante vento occidentali.

♀ in inclinato occidentali.
Fixa erat borealior.

Observationes in congressibus Lunæ & Planetarum cum fixis habitæ sunt ope quadrantis mobilis 2 pedum, sectore 4 pedum ampliati, & tubo 5 pedum instructi. Valor micrometri per δ Orionis definitus est. Una conversio in 100 partes divisa dat in partibus circuli maximi $1' 9'' 31'''$. Discrimen horologii oscillatorii a tempore vero, ex altitudinibus solis correspondentibus, & linea meridiana constabat.

E METEOROLOGICIS.

Frigus maximum anno hoc observatum est die 1. mensis Decembris, mane, cælo sereno, & vento septentrionali leniter spirante. Mercurius in thermometro Fahrenheitiano ad gradum $3\frac{1}{2}$ decedit. Mensibus Januario & Februario horis matutinis, & vespertinis plerumque in gradibus 15, 16, 18, 23 hæsit, die 18. Januarii ad gradum 5 descendit.

Calores hæc cumprimis æstas intensos habuit. Mercurius in thermometro Fahrenheitiano horis pomeridianis frequenter ad gradus 80, 85, 90, 91 pervenit. Die 20. Julii ad gradum 95 ascendit, cælo sereno, aura a meridie placide spirante.

Maxima altitudo mercurii in barametro erat pollicum Parisiensium 28, & $\frac{5}{8}$ lineæ, die 12. Februarii cælo sereno & aëre quieto.

Minima altitudo observata est pollicum Parisiensium 26, & linearum $6\frac{1}{2}$ die 5ta Decembris horis vespertinis, cælo pluvio & vento australi vehementius spirante.

TRANSITUS VENERIS PER DISCUM SOLIS

die 6^{ta} Junii mane.

Rarissimum hoc, & centum viginti duobus annis expectatum phenomenon observavi ope quadrantis mobilis 2. pedum, ampliati sectore 4. pedum, & instructi tubo 5. pedum, cui applicatum habetur micrometrum filare mobile.* Ne autem species ☉ oculo officeret, vitrum planum, probe politum, parte una fumo aquabiliter obfuscatum adhibui. Vento a plaga æstiva leniter spirante, cœli jam inde ab ortu ☉ sudum erat; nisi quod sub horam 6^{am}, per dimidium circiter horæ spatium nubes ☉ occultaverint; horizon tamen copiosis vaporibus refertus, speciem ☉ ebullire fecit adeo, ut nonnullis ☉ exortum contemplantibus, ♀ in gyrum agi videretur. Quo visō quadrante ad perpendiculum utcumque constituto, primas observationes per appulsus limborum ☉ & ♀ ad filum verticale & horizontale suscepi.

OBSERVATIO I.

Datis differentiis Longitudinum ☉ & ♀, item latitudine ♀, ante omnia in tempus conjunctionis ☉ & ♀ geocentricæ, in latitudinem geocentricam pro eodem tempore, & in angulum inclinationis orbitæ apparentis ♀ cum ecliptica indagabam; his enim rite constitutis, reliqua elementa facile me erueri posse videbam. Eapropter designatis, vitandæ confusionis causa, alphabeti literis, illis observationibus, quas in hanc rem adhibere præcui, observationes primæ methodi cum nonnullis observationibus secundæ, & tertiæ methodi, similiter primam secundæ, & tertiæ methodi cum aliquot postremis conferebam his utendo analogiis:

Pro Tempore conjunctionis.

Ut motus ♀ in longitudinem intra duas observationes, est ad differentiam temporis earundem observationum; ita excessus longitudinis ☉, & ♀ prioris observationis, est ad differentiam temporis quæsitam, quæ addita tempori prioris observationis, exhibebit tempus Conjunctionis.

Pro Latitudine.

Ut differentia temporis intra duas observationes, est ad excessum latitudinis earundem observationum; ita differentia temporis superiori analogia inventa, est ad excessum latitudinis quæsitum; hic additus latitudini prioris observationis, dabit latitudinem pro tempore conjunctionis.

Pro angulo inclinationis orbitæ apparentis ♀ cum ecliptica.

Ut motus ♀ in longitudinem intra duas observationes, est ad excessum motus ♀ in latitudinem earundem observationum; ita sinus totus, ad tangentem anguli inclinationis. Subjicio reperta.

Ex invento tempore vero conjunctionis $6^h 53' 44''\frac{1}{2}$

Latitudine pro eodem tempore $9' 29'' 44''$

Angulo inclinationis apparentis $9' 16' 4''$

Residua elementa hac via perveſtigavi :

Sit A B C D discus ☉, A C ecliptica, G H latitudo ♀ pro tempore conjunctionis, angulus E H G, quem efficit orbita ♀ cum circulo latitudinis, & qui est complementum anguli inclinationis apparentis. E F orbita ♀

In $\triangle$ rectangulo I G H ex cognitis angulis, & G H calculo trigonometrico primum obtinetur I H = $1' 31'' 45'''$, quæ est differentia inter ☉ & medium transitus; dein I G = $9' 22'' 38'''$, quæ est distantia minima ♀ a centro ☉ in medio transitu.

Uterius inveniendus est valor H F. In $\triangle$ H G F nota habentur semidiameter ☉ G H = $15' 48'' 30'''$, G H = $9' 29'' 44'''$, cum angulo G H F = $99' 16' 4''$, anguli I H G complemento ad duos rectos. Ex his per Trigonometriam reperietur angulus G F H $36' 21' 32''$, consequenter angulus H G F $44' 22' 24''$. Unde eruitur H F = $11' 12'' 5'''$, quæ si addantur ad H I = $1' 31'' 45'''$, obtinebitur I F = $12' 43'' 50'''$, quæ est dimidia semita ♀; igitur E F tota Semita, quam centrum ♀ ab ingressu ad exitum confecit, erit $25' 27'' 40'''$.

Porro, ut momenta temporum ingressus centri ♀ in E, transitus medii in I, ac denique exitus in F haberentur, inquirendum erat in quantitatem L F, quæ est differentia inter exitum centri ♀ verum, & apparentem. Nam quando centrum ♀ vi parallaxis TYRNAVIÆ jam in egressu spectabatur, e centro

terræ existere duntaxat visum fuisset in L. * Ex meis calculis, & operationibus L F reperi $7'' 19'''$, quibus detractis ex H F, habetur H L = $11' 4'' 46'''$. Jam cum H L conveniant $2^h 44' 38''$ ex observatione, quantitati L F respondebunt $1' 48''$; igitur centrum ♀ fuit in egressu vero $9^h 40' 10''\frac{1}{2}$. Nec minus de medio transitus in tempore constat; I H enim conveniunt $22' 43' 20''$ horaria, quibus a tempore ♂ $6^h 53' 44''\frac{1}{2}$, ablatis, dabitur tempus, quo centrum ♀ in I extitit. $6^h 31' 1'' 10'''$.

Dimidia proinde duratio centralis erat. $3^h 9' 9'' 20'''$, quæ si dematur a tempore medii transitus, dabitur tempus veri ingressus centri ♀ in E $3^h 21' 51'' 50'''$.

His obtentis, illud restabat agendum, ut invenirentur: M E latitudo geocentrica, M G differentia longitudinis geocentricæ, quam ♀ habuit in ingressu vero; similiter N F latitudo geocentrica, N G longitudinis geocentricæ differentia in egressu vero. Id, quod in hunc modum præstitum:

In triangulo E G H ex notis angulis E H G, & G E H, qui æqualis est angulo H F G, innotescit angulus E G H $62^\circ 54' 32''$, qui subductus ex angulo recto A G H cognitum facit angulum A G E $27^\circ 5' 28''$. Datis igitur in $\triangle$ rectangulo M G E angulis & Semidiametro $\odot$ E G, definiuntur quoque per Trigonometriam M E = $7' 11'' 56'''$. & M G = $14' 4'' 25'''$.

In $\triangle$ autem H F G angulus H G F est $44^\circ 22' 24''$, qui si auferatur ab angulo recto C G H, relinquet angulum C G F. $45^\circ 37' 36''$. Jam in $\triangle$ rectangulo G F N nota est præter angulos, semidiameter $\odot$ G F, igitur calculo Trigonometrico reperietur F N $11' 17'' 58'''$, & G N $11' 3'' 18'''$.

Nunc reducendæ veniunt latitudines geocentricæ, & differentiæ longitudinum geocentricarum ad heliocentricas, quæ cum ad illas sint, ut distantia ♀ a ☿, ad distantiam ♀ a $\odot$; datis ex Tabulis D. Cassini, distantis ♀ a $\odot$ 7265, & ♀ a ☿ 2889, ita correspondentes latitudines heliocentricæ, & differentiæ longitudinum heliocentricarum habebunt. M E = $2' 51'' 46'''$ N F = $4' 29'' 36'''$ M G = $5' 35'' 47'''$ G N = $4' 23'' 19'''$.

Cum vero tempori ♂ respondeat locus $\odot$ verus $\Pi 15^\circ 36' 17''$, erit locus ♀ heliocentricus ad eclipticam reductus $\sphericalangle 15^\circ 36' 17''$. latitudo heliocentrica $3' 46'' 33'''$.

* Vide Methodum D. Cassini in actis Parisinis ad Annum 1743. pag. 509. Edis. Holland.

E quibus apparet, centrum ♀ tempore transitus per discum ☉ motu in latitudinem $1^{\circ} 37' 50''$, motu autem in longitudinem relate ad eclipticam $9' 59'' 6'''$ confecisse; His si addantur $15' 4'' 6'''$ quæ interea temporis ☿ absolvit, erunt $25' 3'' 12'''$, tota differentia locorum ♀ sub ingressum, & exitum secundum longitudinem heliocentricam, qualis ex ☉ intervallo $6^h 18' 18'' 40'''$ spectaretur.

Porro in $\triangle$ rectangulo O E F, patet EO = MN exhibere longitudinem heliocentricam paulo ante repertam; O F esse discrimen latitudinis heliocentricæ; inde per Trigonometriam reperietur semita ♀ E F, quam intra $6^h 18' 18'' 40'''$ ♀ circa ☉ confecit, $25' 6'' 26'''$. Motus proinde horarius verus in orbita est $3' 58'' 55'''$

Si fiat hæc analogia: ut $1^{\circ} 37' 50'' : 6^h 18' 18'' 40''' = 2' 51'' 46''' : \text{tempus quæsitum}$. Obtinebitur intervallum temporis, intra quod centrum ♀ a nodo ad ingressum pervenit = $11^h 4' 10'' 40'''$.

Hac vero analogia: ut $6^h 18' 18'' 40''' : 25' 3'' 12''' = 11^h 4' 10'' 40''' : \text{arcum quæsitum}$, reperietur arcus eclipticæ inter nodum, & ingressum interceptus $43' 59'' 30'''$

Jam ♀ ab ingressu ad conjunctionem secundum longitudinem heliocentricam absolvit $5' 35'' 47'''$, quibus additus respondens ☿ motus $8' 26'' 18'''$ dabit summam $14' 2'' 5'''$, quæ si addatur arcui eclipticæ invento, habebitur arcus eclipticæ a nodo usque ad ☿ $58' 1'' 35'''$.

Ex his facile deducitur locus verus ♄ descendens; nam in ☿ locus ♀ verus ad eclipticam reductus erat $\nearrow 15^{\circ} 36' 17''$, unde si auferantur $58' 1'' 35'''$, prodit locus ♄ descendens $\nearrow 14^{\circ} 38' 15'' 25'''$.

Angulus vero inclinationis ex $\triangle$ E O F per Trigonometriam sphericam eruitur esse: $3^{\circ} 32' 10''$; nam angulus O E F ob E O parallelam ipsi A C, æquatur angulo inclinationis. Sed nunc e sparsim recensitis nonnulla sub uno aspectu ponere juvat.

Immersiones atque emerfiones Satellitum Jovis.

DIE 6. JULII.

Cælo utcumque sereno, sub crepusculum matutinum Jove 37 gradus circiter alto tubo 4 pedum Newtoniano observata est immerfio Satellitis I.

Lux Satellitis imminuta videtur	-	-	-	-	-	15	30	19
Evanescit	-	-	-	-	-		31	33

DIE 22 JULII.

Cælo fudo, aëre tranquillo, Jove 12 gradus circiter alto, D haud procul distante, tubo 4 pedum Newtoniano observata est emerfio Satellitis III.

Satelles ex umbra emergit.	-	-	-	-	-	11	15	22
Totus emerfisse videtur	-	-	-	-	-		17	56

E A D E M D I E.

Cælo perinde sereno, Jove 33 gradus circiter alto, tubo 4 pedum Newtoniano observata est immerfio Satellitis I.

Lux Satellitis debilitari videtur	-	-	-	-	-	13	44	27
Totus in Umbra	-	-	-	-	-		45	47

DIE 29. JULII.

Cælo fudo, aëre pacato, Jove 14 circiter gradus alto, tubo 4 pedum Newtoniano observata est emerfio Satellitis III.

Satelles videri incipit	-	-	-	-	-	15	13	12
Totus extra Umbram	-	-	-	-	-		16	0

E A D E M D I E.

Cælo sereno, sub crepusculum matutinum, Jove 41 circiter gradus alto, tubo 4 pedum Newtoniano observata est immerfio Satellitis I.

Satelles luce privari videtur	-	-	-	-	-	15	37	41
Disparet	-	-	-	-	-		39	23

D I E 21. A U G U S T I.

Cælo sereno, aëre vento vehementiori agitato, Jove 35 gradus circiter alto, tubo 4 pedum Newtoniano observata est immerfio Satellitis I.

Satelles deficere videtur	-	-	-	-	-	15	51	4
Totus in Umbra	-	-	-	-	-		52	45

DIE 23. AUGUSTI.

Cælo fudo, Jove supra 22 gradus alto, tubo 4 pedum Newtoniano observata est immerfio Satellitis I.

Satellitidis lux imminuitur	-	-	-	-	-	10	19	56
Immerfio totalis, & certa	-	-	-	-	-		21	52

DIE 27 AUGUSTI.

Cælo fereno, aëre quieto, Jove alto gradus circiter 21, tubo 4 pedum Newtoniano observata est immerfio Satellitis IV.

Lux Satellitis imminui videtur	-	-	-	-	-	9	43	58
admodum debilis apparet	-	-	-	-	-		51	6
Immerfio totalis	-	-	-	-	-		51	36

EADEM DIE.

Tempore fereno, Jove alto circiter gradus 39, tubo 4 pedum Newtoniano observata est emerfio Satellitis IV.

Satelles emergit	-	-	-	-	-	12	46	19
Totus extra umbram positus videtur	-	-	-	-	-		54	52

DIE 30 AUGUSTI

Nocte serena, & illumi Jove alto gradus circiter 38, tubo 4 pedum Newtoniano observata est immerfio Satellitis I.

Satelles debilis apparet	-	-	-	-	-	12	17	21
Immerfio certa	-	-	-	-	-		8	9

DIE 1. SEPTEMBRIS.

Cælo fudo, aëre pacato, Jove alto gradus circiter 15, tubo 4 pedum Newtoniano observata est immerfio Satellitis II.

Satelles multo debiliori luce fulget	-	-	-	-	-	8	57	30
Immerfio certa	-	-	-	-	-		58	44

DIE 3. SEPTEMBRIS.

Cælo fudo, aëre vento non nihil agitato, Jove alto gradus circiter 12, tubo 4 pedum Newtoniano observata est immerfio Satellitis III.

Satelles deficere videtur	-	-	-	-	-	8	29	39
difficulter videtur	-	-	-	-	-		32	49
Immerfio certa	-	-	-	-	-		33	9

DIE 8. SEPTEMBRIS.

Cælo sereno quidem, at vento vehementiori spirante, Jove alto gradus circiter 17, tubo 4 pedum Newton. observata est immerfio Satellitis I.

	Temp. ver.		
	H	M	S.
Satelles multum debilis apparet	8	41	57
Disparet		42	44

E ADEM DIE.

Jove alto circiter gradus 38, tubo 4 pedum Newton. observata est immerfio Satellitis II.

Satelles defecisse apparet	11	36	5
Immerfio certa		38	40

DIE 17. SEPTEMBRIS.

Vento vehementiori spirante, cælo tamen fudo, Jove alto circiter gradus 14, tubo 4 pedum Newton. tertia ante oppositionem Jovis cum sole die, observata est immerfio Satellitis III.

Satelles debilitatus apparet	16	35	56
debilis admodum videtur		37	40
Immerfio certa		38	20

DIE 24 SEPTEMBRIS.

Tempore fudo, aëre tranquillo, Jove alto circiter gradus 29, die 3tia ab oppositione Jovis cum sole, tubo 4 pedum Newton. observata est emerf. Satel. I.

Satelles ad discum Jovis emergit	9	19	0
----------------------------------	---	----	---

DIE 8. OCTOBRIS.

Cælo aliquantum vaporoso, Jove alto circiter gradus 25, tubo Newtoniano 4 pedum observata est emerfio Satel. I.

Satelles primum confpicitur	13	12	13
Totus extra Umbram		13	39

DIE 31. OCTOBRIS.

Nocte serena, & pacata, Jove alto circiter gradus 14, tubo 4 pedum Newtoniano observata est emerfio Satellit. I.

Satelles emergere videtur	13	29	29
---------------------------	----	----	----

DIE 2. NOVEMBRIS.

Cælo admodum vaporoso, Jove alto circiter gradus 36 tubo 4 pedum Newton. observata est emerſio Satellitis I.

Satelles emergere incipit

Temp. ver.
H. M S.

Assumpta e catalogo fixarum D. L'Abbé de la Caille ad annum ineuntem 1750. ascensione recta vera $\delta \searrow$ 271° 14' 35", 8 & declinatione 29° 54' 15", 4 Austr: ex ejusdem tabulis, quas fundamentis Astronomiæ inseruit, obtinetur ad 18 Mensis Augusti 1763 ascensio recta apparens $\delta \searrow$ 271° 27' 49", 4. Declinatio 29° 54' 34" Austr. e quibus longitudo apparens $\searrow$ 1° 16' 36" Latitudo. 6° 26' 37" Austr.

Habita ascensione recta & declinatione apparente $\delta \searrow$; ex singulis observa-
tionibus ascensiones rectæ, & declinationes centri $\searrow$ visæ & respondentes his lon-
gitudines ac latitudines visæ deducuntur:

Temp. Ver			Ascensiones rectæ. Declinationes. Longitudines. Latitudines.			
H.	M.	S.				
9	28	28	271° 10' 19"	29° 21' 4"	Austr. $\searrow$ 1° 1' 37"	5° 53' 54" Austr.
	32	27	271° 11' 34"	29° 20' 48"	Austr. $\searrow$ 1° 2' 41"	5° 52' 47" Austr.
	38	57	271° 14' 34"	29° 20' 32"	Austr. $\searrow$ 1° 5' 20"	5° 52' 28" Austr.
10	4	55	271° 26' 12"	29° 20' 4"	Austr. $\searrow$ 1° 15' 32"	5° 52' 5" Austr.
	15	26	271° 30' 49"	29° 19' 37"	Austr. $\searrow$ 1° 19' 35"	5° 51' 25" Austr.

Collatis priorum 4 observationum longitudinibus cum longitudi-
ne observationis ultimæ sumptoque medio, conjunctio centri $\searrow$ visæ
in longitudinem accidit h. 10 7' 44" quo tempore centrum $\searrow$ fixæ
borealis erat 34° 50" Latitudo enim centri $\searrow$ visæ fuit. 5° 51' 47"
Austr.

Ex observatione constat tempus verum conjunctionis	
visæ in longitudinem	h. 10 7' 44"
Ex calculo habetur tempus verum conjunctionis ve-	
ræ in longitudinem	h. 9 28' 6"
Hinc ab parallaxi longitudinis contigit citius vera	
quam visæ $\searrow$	h. 0 39' 38"
Ex calculo habetur distantia vera centri $\searrow$ boream	
versus	1° 29' 56"
Ex observatione constat distantiam centri $\searrow$ visam	
boream versus	0° 34' 50"
Hinc colligitur parallaxis latitudinis fuisse	0° 55' 6"

*Praeclara TVAE in literas voluntatis
argumenta plura sunt, quam quae a
nobis pro dignitate recenseri possint.
Vidimus auspiciis TVIS post, quam
amplissimorum Regnorum possessionem adiuisti, sic in
vniuersis his artes omnes, et scientias effloruisse,
ut, quo ultro assurgerent perfectionis, nihil quid-
quam*

quam illis deesse videretur. Impetrasti istud AV-
GVSTA DOMINA, rara illa TVA Munificen-
tia, qua Licaea bonis artibus constituisti amplissi-
ma, & summa illa Clementia, qua collocata cum
Vindobonae, tum apud nos instituendae Iuventuti
Nobili Collegia liberalissime adhuc protexisti, in
quibus, praeter morum probitatem, iis praeterea
imbuerentur artibus, quarum cognitione, et TVIS,
et sacerrimis Reipublicae votis responderet. Impe-
trasti Maternis illis amoribus, quibus illo TE non-
nunquam deduci passa es, ut oblita Maiestatis, et
Viris, qui in scientiis cum non nulla laude versati
fuissent, non raro colloqui sustineres, et praesens
teneras stimulare, hortarique mentes non refugeres.
Probe nimirum TV quidem nouisti, quantum in-
tersit, ut summi etiam Principes, quorum utramque
in partem ponderis maximi semper est auctoritas,
studia

2
studia literarum foueant, atque de sua interdum dignitate decedant, quo, qui illis se addixerint, stimulos, et incitamentum adiungant, quod quidem TV & fecisti, & facis hodie cumulatissime, quando ad ceteros, quos bonis artibus in Apostolico hoc TVO Regno prouehendis haecenus impendisti fauores, istud adiunxisti etiam, ut, tot licet amplissimarum Prouinciatarum distenta curis praesentem TE nobis indulgeres, quo propensissimum TVVM aduersus scientias animum isthic, ubi principem totius Regni Sacratissima MAIORVM TVORVM voluntas sedem illis defixit, ex praesente iam etiam vultu contueri nobis liceret. Atque istud est denique, quod animos nobis addidit, tenues uti hos, quos obseruandis siderum motibus, prouehendaeque, quae TVOS item nunquam non experta est fauores, Astronomiae impendimus, labores, donum cer-

*te MAIESTATE TVA longe inferius, NOMINI

Eclipsis Lunæ die 24. Februarii facta
A P. WEISS.

Tempore hujus eclipses cælum nubibus obductum erat, & tametsi Luna per intervalla per nubes rariores traluceret; quia tamen mox densioribus involvebatur nubibus, nunc limbus Lunæ illuminatus, nunc umbra terræ fati discerni nequirit, hinc nulla certa phasis determinari potuit. Sub finem Luna in sereno versabatur. Tubo 5. ped. dioptrico.

Observationes Astronomicae Anno 1769. Instituta.

Inquisitio in elevationem Poli Observatorii Tyrnaviensis per fixas prope verticales.

Hac cumprimis ætate, qua Astronomia majora indies capit incrementa, plurimum Observatoris interest, ut loci sui, observationibus qua possunt accuratatione institutis, altitudinem Poli definitam habeat, & error, siquis adhuc intercedat, inter limites quam arctissimos constringatur.

Huic intento serviunt Fixæ prope verticem culminantes, quantum declinatio a Celeberrimis Astronomis exacte determinata est. Nam cum refractione ad verticem exigua sit, in his periculum omne erroris, quod a refractione proveniret, suffertur, & in ipso organo si quid vitii lateret, per inversionem patescit.

Hunc in finem parabatur sector, radii 9 ped. 8. poll. $1\frac{1}{2}$ lin. qualem Celeb. R. P. Boschovics e S. J. in libro suo, de expeditione literaria per ditionem Pontificiam descripsit: nonnullis quæ pro majore vel firmitate vel commoditate facere videbantur, mutatis.

Machina hæc anno 1769. absoluta est, eique tubus dioptricus 11. ped. applicitus. Cognito sectoris statu, & cautelis, ut in similibus organis sit, adhibitis, septem Fixarum distantiam a vertice indagavi, ad lumen diurnum, ut quævis refractione etiam ex lumine lampadis proveniens evitaretur, sectoris quoque planum jam ad ortum, jam ad occasum converti.

Fixarum harum declinationes recentissimis observationibus definitæ, habentur e Catalogo Fixarum Cel. D. Maskelyne, differuntque nonnihil ab iis, quas Catalogus D. L' Abbé de la Caille exhibet, & quibus tum, cum his observationibus intentus essem, utebar.

Hanc elevationis poli determinationem eſſe proxime veram, & intra limitem duorum triumve ſecundorum conſiſtere, perſuadet mihi Diſſertatio de obſervatione tranſitus Veneris ante diſcum Solis die 3. Junii 1769. Wardoëhuſii facta, Viri Celeberrimi, & Aſtronomi profundiffimi R. Patris Hell, qui pro ſingulari ſua in me benevolentia Haſſnia ejuſdem exemplar tranſmiſit, mihi ſub finem menſis Aprilis 1770. reddidit. Hic felix, & in praxi Aſtronomica utiliſſimum inventum legi, ſcilicet: ſi binæ obſerventur fixæ intra eundem, aut prope eundem altitudinis gradum culminantes, una ad partem cœli auſtrinam, altera ad boream, quadrante quantumvis erroneo, atque errore ejuſdem incognito, per fixas has refractione quacunque affectas, nulla adhibita correctione refractionis in tabulis expreſſæ, exactam elevationem poli definiri.

Inter meas fixas eidem tangentis puncto, proximas reperi β Draconis ex parte borea, ex parte auſtrina α Cygni. Hanc methodum die 10. Maji ſecutus ſum.

β Draconis.

	35	9	Finis.											

Ex principio & fine duratio 1^h 34' 27''.

Magnitudo obscurationis dig. 3. min. 31, 5. Diametrum solis post eclipsim micrometro reperi 31' 35'', 7. quam etiam in supputandis phasibus adhibui. Diametrum Lunæ horizontalem ex tabulis Lunaribus D. Mayer 33' 30'' assumpsi.

Ex fine eclipseos in conjunctionem veram Lunæ cum sole investigavi via ac methodo parallactica, quam Cel. R. P. Hell in observatione transitus Veneris ante discum solis die 3. Junii 1769. Wardoehusii facta, & Hafniæ edita, adhibuit.

Elementa calculi conjunctionis veræ ad meridianum G. M. S.
Tyrnaviensem.

Longitudo Lunæ vera	13	52	39,
Latitudo Lunæ vera borealis	0	55	44, 3
Parallaxis Lunæ horizontalis	1	1	23,
Reductio parall. ad parallelum Tyrnaviensem subtr.	0	0	10,
Parallaxis horizontalis solis subtr.	0	0	8,
Parallaxis horizontalis Lunæ a sole	1	1	5,
Diameter horizontalis Lunæ	0	33	30,
Augmentum diametri Lunæ ad altitudinem Obfer.	0	0	28, 7
Diameter Lunæ apparens in fine eclipseos	0	33	58, 7
Diameter solis	0	31	38,
Motus horarius Lunæ a Sole	0	35	34,
Altitudo nonagesimi	58	2	49, 9
Nonagesimus	50	52	42, 6
Distantia Lunæ a nonagesimo appar.	23	20	11, 6
Parallaxis Longitudinis Lunæ	0	20	31, 8
Parallaxis Latitudinis Lunæ	0	32	0, 1

Ex his.

Habetur distantia centrorum Solis & Lunæ, seu summa semidiametrorum in fine eclipseos apparens $32' 48''$, 3. & latitudo apparens. $23' 44''$, 2. Jam in triangulo rectangulo, cujus hypothenusa representat summam semidiametrorum, altitudo latitudinem apparentem, reperitur basis, seu distantia apparens centri Lunæ in longitudinem $22'$, $38''$, 5. est vero parallaxis Longitudinis Lunæ $20' 31''$, 8.

Ergo distantia Lunæ a sole vera $2' 6''$, 7. hæc per motum horarium Lunæ a sole in tempus conversa, efficiunt $3' 33''$, 4. temp. quæ subtracta a tempore vero Observationis, dant tempus verum conjunctionis veræ ad meridianum Tyrnaviensem $21^h 31' 35''$, 6.

Celeb. R. P. Hell in eadem dissertatione ex fine hujus eclipseos Parisiis a Cel. D. Messier observato, obtinuit tempus verum conjunctionis veræ ad Meridianum Parisinum $h 20 30' 36''$. Quod tempus subtractum a tempore conjunctionis veræ ad meridianum Tyrnaviensem, relinquit differentiam meridiani Tyrnaviensis a Parisino, qua Tyrnavia est Orientalior: $1^h 0' 59''$, 6. majorem $4''$, 6, quam ex collatis inter se magno numero eclipsibus Satellitum Jovis definitam habemus.

In hac deductione ut similiter agerem, usus sum diametro solis $31' 38''$, & parallaxi horizontali $8''$.

Observatio ejusdem eclipsis solis facta a P. Taucher
ope tubi dioptrici 4. pedum. Diameter solis sumpta
31' 37'' æquatur partibus micrometri 2682.

Hac die ascensio recta Saturni excedit ascensionem rectam δ II hinc apparet, conjunctionem in ascensionem rectam intra 20 & 21 Maji evenisse. Die 20. Maji differentia ascensionis rectæ intra Saturnum & δ II erat 4^m 0^s 6^s, quam Saturnus conficit 14^h 57^m 34^s. queis additis ad tempus appulsus centri Saturni ad horarium 8^h 34^m 45^s. Saturnus eandem ascensionem rectam apparentem, quam δ II habuit: die 20. Maji h 23 32^m 19^s. temp. ver. differentia parallelorum existente 7^m 38^s, 5 qua Saturnus erat borealior. Collata autem utriusque longitudine geocentrica apparente, Conjunctio in longitudinem sequebatur 3^h 29^m 21^s. Saturnus ergo erat in 15^o 17^m 59^s, ☿ die 21 Maji h 3 1^m 40^s temp. ver. & borealior quam δ II 7^m 39^s, 4.

Cometa, qui hoc anno mense Junio apparuit, hic primum die 26 Junii in scito Sobiesciano visus fuit. Erat in eo nucleus minus lucidus & distinctus, sine cauda, pallida circumdatus atmosphaera. Loca ejusdem bina duntaxat, ob nubila fere tempora, determinata sunt.
